

Problems :-

1) A license plate consists of two English letters followed by 4 digits. If repetitions are allowed, how many of the plates have only vowels and even digits?

Soln:- Each of the first 2 positions can be filled in 5 ways (with 5 vowels) & each of the remaining 4 places can be filled in 5 ways (with digits 0, 2, 4, 6, 8)

eⁿ No. of possible license plates of the given type is
 $(5 \times 5) \times (5 \times 5 \times 5 \times 5) = 5^6 = 15,625.$

2) Cars of a particular company come in 4 models, 12 colors,

3 engine sizes, & 2 transmission types.

(a) How many distinct cars of this company can be manufactured?

(b) Of these, how many have the same color?

Soln:- (a) The no. of distinct cars that can be manufactured is

$$4 \times 12 \times 3 \times 2 = 288.$$

(b) For any chosen color, no. of distinct cars that can be manufactured is

$$4 \times 3 \times 2 = 24$$

3) Find the no. of 3-digit even nos with no repeated digits.

Soln:- Consider the no. in the form xyz, where each of x, y, z represents a digit.

Since xyz has to be even \Rightarrow z has to be 0, 2, 4, 6 (or) 8.

If $z=0$ then x has 9 choices & y has 8 choices.
 \hookrightarrow 1 choice only

If $z=2, 4, 6, 8$ then x has 8 choices & y has 8 choices
 \hookrightarrow 4 choices
[Note that y can take 0, x cannot take 0.]

? The desired number is $(9 \times 8 \times 1) + (8 \times 8 \times 4)$
 $= 72 + 256$
 $= 328$ \approx

- 4) A bit is either 0 (or) 1. A byte is a sequence of 8 bits. find
- the no. of bytes
 - the no. of bytes that begin with 11 & end with 11
 - the no. of bytes that begin with 11 & do not end with 11.
 - the no. of bytes that begin with 11 (or) end with 11.

Soln:-

(i) Since each byte contains 8 bits & each bit is a 0 (or) 1 (two choices), the no. of bytes is $2^8 = 256$.

$\therefore \boxed{1 \ 1 \ 1 \dots \ 1}$ constitutes a byte
 $\begin{matrix} \text{0 or 1} \\ 2 \times 2 \times \dots \times 2 \text{ (8 times)} = 2^8 \end{matrix}$

(ii) In a byte beginning & ending with 11, there are 4 empty positions. These can be filled in $2^4 = 16$ ways.
 \therefore There are 16 bytes which begin & end with 11.

$\boxed{\begin{matrix} 11 & \boxed{1} & \boxed{1} & \boxed{1} & 11 \\ \text{0 or 1} & 2 \times 2 \times 2 \times 2 = 2^4 \end{matrix}}$

(iii) In a byte beginning with 11, there are 6 empty positions. These can be filled in $2^6 = 64$ ways.

Thus there are 64 bytes that begin with 11.

Now, since there are 16 bytes that begin & end with 11, the no. of bytes that begin with 11, but do not end with 11 is $64 - 16 = 48$.

(iv) No. of bytes that end with 11 is 16 (by result (iii)).

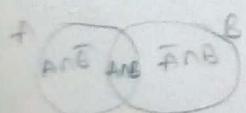

Also no. of bytes that begin & end with 11 is 16.

\therefore no. of bytes that begin (or) end with 11 is

$64 + 64 - 16 = 112$. $\left[\because \text{for any 2 finite sets } A \text{ & } B, |A \cup B| = |A| + |B| - |A \cap B| \right]$

(v) Begin with 11, but do not end with 11 = Begin with 11 & end with 11

(vi) Begin with 11 (or) end with 11 = Begin with 11 + end with 11 - Begin & end with 11

(iii) \Rightarrow To find $A \cap B$

(iv) \Rightarrow To find $A \cup B$

A	: Begin with 11
B	: End with 11
$A \cap B$: Begin & end with 11
$A \cup B$: Begin (or) 11

5) find the number of proper divisors of 441000 excluding 1 & itself (Q(a))

Soln:- we have $441000 = 2^3 3^2 5^3 7^2$

\therefore Every divisor of $n = 441000$ must be of the

$$form d = 2^p 3^q 5^r 7^s, \text{ where } 0 \leq p \leq 3,$$

$$0 \leq q \leq 2, 0 \leq r \leq 3, 0 \leq s \leq 2.$$

$\therefore p$ can be chosen in 4 ways, q in 3 ways,

r in 4 ways and s in 3 ways.

2	441000
2	220500
2	110250
3	55125
3	18375
5	6125
5	1225
5	245
7	49
7	7

Thus total no. of divisors $= 4 \times 3 \times 4 \times 3 = 144$.

but total no. of proper divisors $= 144 - 2 = 142$

[$-2 \because$ a no. is always divisible by 1 and by itself;
so leaving these 2 choices]

6) License plates consists of 2 letters followed by 4 digits.

In how many ways can this be done if

(i) No letter or digit can be repeated

(ii) Repetitions are allowed.

(iii) only vowels & even digits can be used (with repetitions)

Soln:- (i) $\underline{\text{letter}} \quad \underline{\text{letter}}, \quad \underline{\text{digit}} \quad \underline{\text{digit}}$

Since there are 26 alphabets (letters) in English, the 1st place

can be filled has 26 choices, 2nd place has 25 choices

(since no repetition is allowed).

\therefore Total no. of ways it can be done is ~~$26 \times 25 = 650$~~

(iii) the digits are 10 in number (0, 1, 2, ..., 9)

\therefore 1st place can be filled in 10 ways, 2nd in 9 ways,

3rd in 8 ways, 4th in 7 ways.

\therefore Total no. of ways this can be done is $26 \times 25 \times 10 \times 9 \times 8 \times 7$

$$= 32,76,000$$

$$(i) (26 \times 26) \times (10 \times 10 \times 10 \times 10) = 26^2 \times 10^4 = 67,60,000$$

" repetitions are allowed.

(ii) there are 5 vowels to be used & even digits \Rightarrow

0, 2, 4, 6, 8 (5 choices)

$$\therefore (5 \times 5) \times (5 \times 5 \times 5 \times 5 \times 5) = 5^6 = \cancel{78125} \cdot 15,625$$

7) find the total no. of the integers that can be formed from the digits 1, 2, 3, 4 if no digit is repeated in any one integer.

Soln:- Let s_1, s_2, s_3, s_4 denote the no. of integers containing 1 digit, 2 digits, 3 digits, 4 digits resp.

$s_1 \rightarrow$ 1 digits only \Rightarrow 4 choices
(1 or 2 or 3 or 4)

there are 4 integers containing exactly 1 digit $\therefore s_1 = 4$
A 2 digit integer without repetition can be chosen in $4 \times 3 = 12$ ways. i.e $s_2 = 12$

$\downarrow \quad \downarrow$ 3 choices
4 choices

A 3 digit integer without repetition can be chosen in

$$4 \times 3 \times 2 = 24 \text{ ways i.e } s_3 = 24$$

$\downarrow \quad \downarrow \quad \downarrow$
4 3 2

$$\text{Hence } s_4 = 4 \times 3 \times 2 \times 1 \Rightarrow s_4 = 24$$

$$\begin{aligned} \text{thus the required no. is } & s_1 + s_2 + s_3 + s_4 \\ & = 4 + 12 + 24 + 24 \\ & = 64. \end{aligned}$$

- (i) Determine the no. of 6 digit integers (no leading 0's)
 (ii) No digit is repeated
 (iii) No digit is repeated & it is divisible by 5.

$$(ii) \text{ Soln:- } (i) \quad \underline{\underline{\underline{\underline{\underline{\underline{\quad}}}}}} \quad 9 \times 9 \times 8 \times 7 \times 6 \times 5 =$$

No zero
There are 2 possibilities
(ii) if last place is 0 \Rightarrow $\underline{\underline{\underline{\underline{\underline{\quad}}}}} \frac{0}{5}$ choice
Case (i)

$$9 \times 8 \times 7 \times 6 \times 5 \times 1 = s_1 (\text{key})$$

Case(2) :- If last place is not 0, i.e. unit place (2) (b)
 takes 2, 4, 6, 8 (4 choices), then total no. of
 choices = $8 \times 8 \times 7 \times 6 \times 5 \times 4 = S_2 (192)$ ----- $\frac{24 \times 6 \times 8}{\downarrow}$
 4 choices

Thus req. no. = $S_1 + S_2 =$

(iii) Case(1) :- If unit place is zero,

$$----- \frac{0}{\downarrow} \quad 9 \times 8 \times 7 \times 6 \times 5 \times 1 = S_3.$$

1 choice

Case(2) :- If unit place is not zero, i.e. ~~not~~ 5.

$$8 \times 8 \times 7 \times 6 \times 5 \times 1 = S_4$$

$\frac{4}{\downarrow} \quad \downarrow \quad \frac{5}{4 \text{ choice}}$

No zero,
No 5

\therefore req. no. = $S_3 + S_4 =$

(3)

Permutations :- Linear arrangement of distinct objects is called Permutation.

Number of arranging 'r' distinct objects out of 'n' objects is denoted by $P(n, r)$ or ${}^n P_r$

$$\text{and } P(n, r) = n(n-1)(n-2) \dots (n-(r-1))$$

$$= \frac{n!}{(n-r)!}$$

Note :- 1) No. of different arrangement of 'n' objects taken all 'n' at a time $= n!$. This is the no. of permutations of 'n' distinct objects.

2) Suppose we wish to find the no. of permutations that can be formed from a collection of 'n' objects of which n_1 are of one type, n_2 are of II type, n_3 are of III type, ..., n_k are of Kth type and $n_1 + n_2 + \dots + n_k = n$, then no. of permutations of 'n' objects taken all at a time $= \frac{n!}{n_1! n_2! \dots n_k!}$

3) Circular arrangement of n different objects is $(n-1)!$.

Problems 6 - Order $\rightarrow 1, 9, 11, 7, 8, 2, 3, 5, 4, 6$

Q) 5 Men and 4 women sit in a row such that the women occupy the even places. How many such arrangements are possible?

Soln:- 5 men be seated in $5!$ ways and 4 women be placed in even places in $4!$ ways.

∴ Total no. of arrangements is $5! \times 4! = 120 \times 24 = 2880$.

$$\Rightarrow n(n-1) = 90.$$

$$\Rightarrow n^2 - n - 90 = 0.$$

$$\Rightarrow n^2 - 10n + 9n - 90 = 0.$$

$$\Rightarrow n(n-10) + 9(n-10) = 0$$

$$(n-10)(n+9) = 0$$

$$n = 10, -9.$$

$$\therefore \boxed{n = 10}$$

$$(ii) P(n, 3) = 3 \cdot P(n, 2)$$

$$\frac{n!}{(n-3)!} = 3 \cdot \frac{n!}{(n-2)!}$$

$$\frac{(n-2)!}{(n-3)!} = 3.$$

$$\frac{(n-2)!}{(n-3)!} = 3$$

$$\frac{(n-2)(n-3)!}{(n-3)!} = 3$$

$$\Rightarrow n-2 = 3$$

$$\boxed{n = 5}$$

2) How many different strings (sequences) of length 4 can be formed using the letters of the word FLOWER?

Soln:- FLOWER has 6 letters, all of which are distinct.

The required no. of strings is the no. of permutations of these six letters chosen 4 at a time.

$$\text{No. is } P(6, 4) = \frac{6!}{(6-4)!} = \frac{6!}{2!} = \frac{6 \times 5 \times 4 \times 3 \times 2!}{2!} \\ = 360.$$

3) find the no. of distinguishable permutations of the letters in the following words:

(i) BASIC (ii) CALCULUS (iii) MATHEMATICS

(iv) STRUCTURES (v) ENGINEERING

Soln:- (i) The word BASIC has 5 letters, all letters being distinct.

∴ No. of permutations of BASIC is $5! = 120$.

(ii) The word CALCULUS has 8 letters, of which 2 are C, 2 are L, 2 are U, and 1 each are A & S.

∴ Required No. of permutations is $\frac{8!}{2! 2! 2! 1! 1!} = 5040$

(iii) The word "Mathematics" has 11 letters, in which (4)
 $(n=11)$

$$\begin{array}{lll} M = 2 & H = 1 & C = 1 \\ A = 2 & E = 1 & S = 1 \\ T = 2 & I = 1 & \end{array}$$

$$\therefore \text{No. of permutations is } \frac{11!}{2! 2! 2! 1! 5!} = 49,89,600$$

(iv) STRUCTURES has $\underset{(n=10)}{\cancel{10}}$ letters, where

$$S = 2, T = 2, R = 2, U = 2, C = 1, E = 1, \cancel{E}$$

$$\therefore \text{No. of permutations is } \frac{10!}{2! 2! 2! 2! 1! 1!} = 2,26,800$$

(v) ENGINEERING has 11 letters, where $(n=11)$

$$E = 3, N = 3, G = 2, I = 2, R = 1$$

$$\therefore \text{No. of permutations is } \frac{11!}{3! 3! 2! 2! 1!} = 277,200$$

H) Find the no. of permutations of the letters of the word MASSASAUGA. In how many of these, all four A's are together? How many of them begin with S?

Soln:- (i) Given word has 10 letters of which 4 are A, 3 are

S & 1 each are M, U, G.

$$\therefore \text{Required no. of permutations is } \frac{10!}{4! 3! 1! 1! 1!} = 25,200.$$

(ii) If in a permutation, all A's are to be together, we treat all of A's as one single letter ^{say X}. Then the letters to be permuted read (AAAA), S, S, S, M, U, G, which are 7 in no.

$$\therefore \text{No. of permutations is } \frac{7!}{1! 3! 1! 1! 1!} = 840.$$

(iii) For permutations beginning with S, there occur nine empty positions to fill, where two are S, 4 are I, 1 each are M, U, G.

$$\therefore \text{No. of such permutations} = \frac{9!}{2! 4! 1! 1!} = 7560.$$

5) Find the no. of permutations of the letters of the word MISSISSIPPI. How many of these begin with ^{an} I? How many of these begin ^{4 end} with a S? ~~These~~ ~~if~~ ~~they~~ ~~have no consecutive S's?~~

Soln:- (i) Given word has 11 letters, in which there are 4 I's, 4 S's, 2 P's, 1 M.

$$\therefore \text{No. of permutations is } \frac{11!}{4! 4! 2! 1!} = 34,650$$

(ii) For permutations beginning with I, there occur 10 empty positions to fill, where 3 are I, 4 are S, 2 are P, 1 M.

$$\therefore \text{No. of such permutations is } \frac{10!}{3! 4! 2! 1!} = 12,600$$

(iii) For permutations beginning & ending with S, there occur 9 empty positions to fill, where 2 are S, 4 are I, 2 are P, 1 M.

$$\therefore \text{No. of such permutations} = \frac{9!}{2! 4! 2! 1!} = 3780.$$

(iv) Let all 4 S's be treated as a single letter X, so that there are 1M, 4I, 2P & 1X, totalling to 8. There can be arranged in ~~letter X, so that there are~~ ~~all letters in the~~

6) (a) How many arrangements are there for all letters in the word SOCIOLOGICAL?

(b) In how many of these arrangements (i) A & G are adjacent (ii) all the vowels are adjacent.

~~$$\frac{8!}{1! 4! 2! 1!} = 840 \text{ ways. Also the 4 S's can be arranged among themselves in } 4! \text{ ways.} \therefore \text{req. no.} = 840 \times 4! = 20,160.$$~~

Soln :- (a) Given word has 12 letters, of which 3 are O, 2 each are C, I, L & 1 each are S, A, G. (5)

∴ no. of arrangements of these letters is

$$\frac{12!}{3! \ 2! \ 2! \ 2! \ (1!)^3} = 99,79,200.$$

(b) (i) If in an arrangement, A & G are to be adjacent, we treat A & G together as a single letter say X, such that there are 3 O's, 2 C's, 2 I's, 2 L's, 1 S & 1 X, totalling to 11 letters. These can be arranged in

$$\frac{11!}{3! \ 2! \ 2! \ 2! \ 1! \ 1!} = 8,31,600 \text{ ways}$$

Also, the letters A & G can be arranged among themselves in 2 ways $\left[\because A \& G \rightarrow \text{total } 2, \text{ each is } 1, 1 \right]$
 $\Rightarrow \frac{2!}{1! \ 1!} = 2$

∴ total no. of arrangements in this case is

$$8,31,600 \times 2 = 16,63,200$$

(ii) If in an arrangement, all the vowels are to be adjacent, we treat all the vowels present in the given word (namely A, O, I) as a single letter, say Y, such that there are 2 C's, 2 L's, 1 S, 1 G, 1 Y, totalling to 7 letters. These can be arranged in

$$\frac{7!}{2! \ 2! \ 1! \ 1! \ 1!} = 1,260 \text{ ways.}$$

Also, since the given word contains 3 O's, 2 I's & 1 A, the letters O, I, A (clubbed as Y) can be arranged among themselves as in $\frac{6!}{3! \ 2! \ 1!} = 60 \text{ ways.}$

∴ Total no. of arrangements in this case is

$$1260 \times 60 = 75,600$$

7) How many six digit numbers can one make using the digits 1, 3, 3, 7, 7, 8?

Soln:- Here $n=6$.

The given digits are 1, 3, 3, 7, 7, 8 in which there are
1 is, 2 3's, 2 7's, 1 8.
 \downarrow \downarrow \downarrow \downarrow
1 type 2nd type 3rd type 4th type

No. of six digits no.'s using given digits is $\frac{6!}{1! 2! 2! 1!}$

$$\begin{aligned} &= \frac{6 \times 5 \times 4 \times 3 \times 2}{4} \\ &= 30 \times 6 \\ &= 180. \end{aligned}$$

8) How many the integers 'n' can we form using the digits 3, 4, 4, 5, 5, 6, 7 if we want 'n' to exceed 50,00,000

Soln:- Let $n = x_1 x_2 x_3 x_4 x_5 x_6 x_7$

where x_1, x_2, \dots, x_7 are the given digits.

Since n exceeds 50,00,000, x_1 can take 5 (or) 6 (or) 7.

If $x_1 = 5$, then $x_2 \dots x_7$ is an arrangement of the remaining 6 digits which contains 2 4's & one each are 3, 5, 6, 7.

∴ No. of such arrangements is $\frac{6!}{2! 1! 1! 1! 1!} = 360$.

If $x_1 = 6$, then $x_2 \dots x_7$ is an arrangement of the remaining 6 digits which contains 2 4's, 2 5's, and one each are 3, 7.

∴ No. of such arrangements = $\frac{6!}{2! 2! 1! 1!} = 180$.

(6)

If $x_1 = 7$, then $x_2 \dots x_7$ is an arrangement of the remaining 6 digits which contains 2 4's, 2 5's, 1 each are 3, 6.

\therefore No. of such arrangements is $\frac{6!}{2!2!1!1!} = 180$.

\therefore By sum Rule, the no. of "n's of the desired type is

$$360 + 180 + 180 = 720.$$

9) In how many ways can 6 men & 6 women be seated in a row

(i) if any person may sit next to each other?

(ii) if men & women must occupy alternate seats?

Soln: - (i) If any person may sit next to each other, no distinction be made b/w men & women in their seating.

\therefore Number of ways they can be seated is $12!$ $[\because (6+6)!]$

$$= 47,900,1600$$

(ii) If men & women are to occupy alternate seats, 6 men can be seated in $6!$ ways in odd places & 6 women " " " even places.

\therefore No. of ways in which men occupy ^{odd} place & women occupy even places is $6! \times 6! = 518400$.

III by No. of ways in which men occupy even places & women occupy odd places is $6! \times 6! = 518400$

∴ Total no. of ways men & women occupy alternate seats is $518400 + 518400 = 10,36,800$.

10) for non-negative integers n & r, if $n+1 > r$, prove that

$$P(n+1, r) = \frac{(n+1)}{(n+1-r)} P(n, r).$$

Soln :- we have $P(n, r) = \frac{n!}{(n-r)!}$ & $P(n+1, r) = \frac{(n+1)!}{(n+1-r)!}$

$$\begin{aligned}\therefore \frac{P(n+1, r)}{P(n, r)} &= \frac{(n+1)!}{(n+1-r)!} \times \frac{(n-r)!}{n!} \\&= \frac{(n+1)!}{n!} \times \frac{(n-r)!}{(n+1-r)!} \\&= \frac{(n+1) \cdot n!}{n!} \times \frac{(n-r)!}{(n+1-r)(n-r)!} \\&= \frac{(n+1)}{(n+1-r)}\end{aligned}$$

Thus $\underline{\underline{P(n+1, r)}} = \left(\frac{n+1}{n+1-r}\right) P(n, r)$.

- II) 4 different Mathematics books, 5 different Co books & 2 different GTC books are to be arranged in a shelf.
How many different arrangements are possible if
(a) the books in each particular subject must all be together?
(b) only the mathematics books must be together?

Soln :- (a) The mathematics books can be arranged among themselves in $4!$ ways, the Co books can be arranged among themselves in $5!$ ways, the GTC books can be arranged among themselves in $2!$ ways and the 3 groups in $3!$ ways.

$$\therefore \text{No. of possible arrangements} = 4! \times 5! \times 2! \times 3! = 34,560$$

(b) Since the Mathematics books has to be together,
Consider the 4 Mathematics books as one single book.

Then we have 8 books, which can be arranged in $8!$ ways. But the Mathematics books can be arranged among themselves in $4!$ ways.

$$\therefore \text{The required no. of arrangements is } 8! \times 4! = 9,67,680$$

Combinations: Selecting a set of ' r ' objects from a set of ' n ' objects ($n \geq r$) without regard to order is called a combination of ' r ' objects.

The total no. ^{of combination} of ' r ' different objects that can be selected from ' n ' different objects is denoted by $C(n, r)$ or ${}^n C_r$ and is given by ${}^n C_r = \frac{n!}{(n-r)! r!}$

Note :- ${}^n C_r = {}^n C_{n-r}$.

Problems :-

- 1) How many committees of 5 members with one chair person can be selected from 12 persons?
- Soln :- 1 chair person out of 12 can be selected in 12 ways.
 Remaining 4 members out of 11 persons can be selected in ${}^{11} C_4$ ways.
 \therefore Req. no. of committees = $12 \times {}^{11} C_4$
 $= 3960.$

- 2) A certain Q.P contains 3 parts A, B, C with 4 questions in Part A, 5 in Part B, 6 in Part C. It is required to answer 7 questions selecting atleast 2 from each part. In how many different ways can a student select his questions for answering?

Soln:-	No. of questions it contains	No. of questions chosen		
		case(1)	case(2)	case(3)
A	4	2	2	3
B	5	2	3	2
C	6	3	2	2
No. of ways of selection		${}^4 C_2 \times {}^5 C_2 \times {}^6 C_3$ (S ₁)	${}^4 C_2 \times {}^5 C_3 \times {}^6 C_2$ (S ₂)	${}^4 C_3 \times {}^5 C_2 \times {}^6 C_2$ (S ₃)

$$\therefore \text{Total. no. of ways} = S_1 + S_2 + S_3 = 1200 + 900 + 600 = 2700.$$

3) Find the no. of committees of 5 that can be selected from 7 men and 5 women, if the committee is to consist of atleast 1 man and atleast 1 woman?

<u>Soln:-</u>	Men	Women	No. of committees of 5.
	1	4	${}^7C_1 \times {}^5C_4 = 35$
	2	3	${}^7C_2 \times {}^5C_3 = 210$
	3	2	${}^7C_3 \times {}^5C_2 = 350$
	4	1	${}^7C_4 \times {}^5C_1 = 175$

\therefore Req. no. of committees containing atleast 1 man and 1 woman is
 $35 + 210 + 350 + 175 = 770$.

4) A woman has 11 close relatives and she wishes to invite 5 of them to dinner. In how many ways can she invite them in the following situations:

- i) there is no restriction on the choice
- ii) 2 particular persons will not attend separately.
- iii) 2 " _____ " together.

Soln:- i) Since there is no restriction on the choice, 5 out of 11 can be invited in ${}^{11}C_5$ ways = 462 ways.

ii) Let A and B be 2 ^{particular} persons. The following cases arises:

- a) If both A and B are invited, then no. of ways of selection is ${}^9C_3 = 84$ ways.
- b) If both A and B are not invited, then no. of ways of selection is ${}^9C_5 = 126$ ways.

$$\therefore \text{Total no. of ways} = 84 + 126 = 210.$$

iii) The following cases arises:

- a) If A is invited and B is not invited, then no. of ways of selection is ${}^9C_4 = 126$ ways.
- b) If B is invited and A is not invited, then no. of ways of selection is ${}^9C_4 = 126$ ways.

c) If both A and B are not invited, then no. of ways of selection is ${}^9C_5 = 126$ ways.

$$\therefore \text{Total no. of ways} = 126 + 126 + 126 \\ = 378.$$

5) Find the no. of arrangements of all the letters of the word TALLAHASSEE. How many of these arrangements have no adjacent A's?

Soln:- i) Given word has 11 letters, in which there are 3 A's, 2 each are L's, S's, E's and 1 each are T and H.

$$\therefore \text{No. of such arrangements is } \frac{11!}{8! (2!)^3 (1!)^2} = 8,21,600.$$

ii) If the A's are disregarded, the remaining 8 letters

$$\text{can be arranged in } \frac{8!}{(2!)^3 (1!)^2} = 5040 \text{ ways.}$$

In each of these arrangements, there are 9 possible locations for the 3 A's. [T, L, L, H, S, S, E, E] These

locations can be chosen in 9C_3 ways.

$$\therefore \text{No. of arrangements having no adjacent A's is } 5040 \times {}^9C_3 \\ = 4,23,360.$$

6) Find how many distinct 4-digit integers one can make from the digits 1, 3, 3, 7, 7, 8?

Soln:- The following 3 cases arises:

i) 4-digit integers containing all distinct no.'s (1, 3, 7, 8)
can be done in $4! = 24$ ways.

ii) 4-digit integers containing 2 pair of identical no.'s (3, 3, 7, 7)
can be done in $\frac{4!}{2!2!} = 6$ ways.

P.T.O.

iii) 4-digit integers containing 1 pair of identical no.'s are:

$$\begin{array}{lll} 3,3,1,7 & \text{(6)} & 3,3,7,8 & \text{(6)} \\ 3,3,1,8 & \text{(6)} & 3,3,7,8 & \text{(6)} \\ 7,7,1,3 & \text{(6)} & 7,7,1,8 & \text{(6)} \\ 7,7,3,8 & \text{(6)} & 7,7,3,8 & \text{(6)} \end{array}$$

which are 6 in no.

This can be done in $\frac{4!}{2!1!1!} \times 6 = 72$ ways.

$$\therefore \text{Total no. of ways} = 24 + 6 + 72 = 102.$$

7) A man has 15 close friends of whom 6 are women. In how many ways can he invite 3 or more of these friends to a party if he wants the same no. of men (including himself) as women?

Soln:- Out of 15 friends, 6 are women and 9 are men.

<u>women</u>	<u>Men</u>	<u>No. of ways</u>
2	1 (+ himself in all cases)	$6C_2 \times 9C_1 = 135$
3	2	$6C_3 \times 9C_2 = 720$
4	3	$6C_4 \times 9C_3 = 1260$
5	4	$6C_5 \times 9C_4 = 756$
6	5	$6C_6 \times 9C_5 = 126$

$$\therefore \text{Total no. of ways} = 2997.$$

8) How many bytes contain i) exactly two 1's ii) exactly four 1's iii) exactly 6 1's iv) atleast six 1's.

Soln:- 1 byte = 8 bits and each bit is a 0 or 1.

i) Two 1's can be chosen in $8C_2$ ways and each of the remaining 6 locations are filled by zeroes only (1 choice).
 \therefore No. of bytes containing exactly two 1's = $8C_2 \times 1^6 = 28$.

$$\text{ii}) 8C_4 \times 1^4 = 70.$$

$$\text{iii}) 8C_6 \times 1^2 = 28.$$

iv) atleast 6 1's can be chosen in the following ways:

$$6 \text{ 1's} \Rightarrow {}^8C_6$$

$$7 \text{ 1's} \Rightarrow {}^8C_7$$

$$8 \text{ 1's} \Rightarrow {}^8C_8$$

\therefore NO. of bytes with atleast 6 1's is

$${}^8C_6 + {}^8C_7 + {}^8C_8 = 37.$$

q) Prove the following identities:

$$\text{i) } {}^nC(r-1) + {}^nC(r) = {}^{n+1}C(r).$$

$$\text{ii) } {}^mC(2) + {}^nC(2) = {}^{m+n}C(2) - mn.$$

$$\text{Soln :- i) } {}^nC(r-1) + {}^nC(r) = {}^nC_{r-1} + {}^nC_r$$

$$= \frac{n!}{(n-r+1)! (r-1)!} + \frac{n!}{(n-r)! r!}$$

$$= \frac{n!}{(n-r+1)(n-r)! (r-1)!} + \frac{n!}{(n-r)! r(r-1)!}$$

$$= \frac{n!}{(n-r)! (r-1)!} \left[\frac{1}{n-r+1} + \frac{1}{r} \right]$$

$$= \frac{n!}{(n-r)! (r-1)!} \left[\frac{r+n-r+1}{r(n-r+1)} \right]$$

$$= \frac{n!}{(n-r)! (r-1)!} \times \frac{(n+1)}{r(n-r+1)}$$

$$= \frac{(n+1)!}{r!(n-r+1)!} = {}^{n+1}C(r).$$

$$\text{ii) } {}^mC(2) + {}^nC(2) = \frac{m!}{(m-2)! 2!} + \frac{n!}{(n-2)! 2!}$$

$$= \frac{m(m-1)(m-2)!}{2(m-2)!} + \frac{n(n-1)(n-2)!}{2(n-2)!}$$

$$= \frac{1}{2} [m(m-1) + n(n-1)]$$

$$= \frac{1}{2} [m^2 + n^2 - m - n]$$

$$\begin{aligned}
&= \frac{1}{2} [(m+n)^2 - 2mn - m - n] \\
&= \frac{1}{2} [(m+n)^2 - (m+n) - 2mn] \\
&= \frac{1}{2} [(m+n)(m+n-1)] - mn \\
&= \frac{1}{2} \left[\frac{(m+n)(m+n-1)(m+n-2)!}{(m+n-2)!} \right] - mn \\
&= \frac{1}{2!} \frac{(m+n)!}{(m+n-2)!} - mn \\
&= C(m+n, 2) - mn
\end{aligned}$$

Binomial and Multinomial theorem:

Pg(10) No(13)
not there (14)

A basic property of $C(n,r)$ is that, it is the coefficient of $x^{n-r} y^r$ in the expansion of the expression $(x+y)^n$, where x & y are any two real no.'s. In other words, the expansion of $(x+y)^n$ in powers of x & y is as follows

$$(x+y)^n = x^n + {}^n C_1 x^{n-1} y + {}^n C_2 x^{n-2} y^2 + \dots + {}^n C_{n-1} x y^{n-1} + y^n \\ = \sum_{r=0}^n {}^n C_r x^{n-r} y^r \quad \rightarrow (1).$$

$$\text{Since } {}^n C_r = {}^n C_{n-r};$$

$$(x+y)^n = \sum_{r=0}^n {}^n C_r x^r y^{n-r} \quad \rightarrow (2).$$

Thus ${}^n C_r$ is the coefficient of $x^r y^{n-r}$ in the expansion of $(x+y)^n$.

${}^n C_r$ is also denoted by $\binom{n}{r}$

$$\therefore \begin{aligned} \textcircled{1} \Rightarrow (x+y)^n &= \sum_{r=0}^n \binom{n}{r} x^r y^{n-r} \\ \textcircled{2} \Rightarrow (x+y)^n &= \sum_{r=0}^n \binom{n}{r} x^{n-r} y^r \end{aligned} \quad \left. \right\} \quad \textcircled{3}$$

Expression $\textcircled{3}$ is called Binomial theorem for a +ve integral index 'n'.

The no.'s $\binom{n}{r}$ for $r = 0, 1, 2, \dots, n$, namely $\binom{n}{0}, \binom{n}{1}, \binom{n}{2}, \dots, \binom{n}{n}$

The no.'s $\binom{n}{r}$ for $r = 0, 1, 2, \dots, n$, namely $\binom{n}{0}, \binom{n}{1}, \binom{n}{2}, \dots, \binom{n}{n}$

In the above result are called the Binomial Coefficients.
The generalization of Binomial theorem is known as

Multinomial Theorem:

Statement:— for the integers n & K , the coefficient of $x_1^{n_1} x_2^{n_2} \dots x_K^{n_K}$ in the expansion of $(x_1 + x_2 + \dots + x_K)^n$ is $\frac{n!}{n_1! n_2! \dots n_K!}$ where each $n_i \leq n$ & $n_1 + n_2 + \dots + n_K = n$.

Note :-

1) The general term in the expansion of $(x_1 + x_2 + \dots + x_k)^n$ is
 $\frac{n!}{n_1! n_2! \dots n_k!} x_1^{n_1} x_2^{n_2} \dots x_k^{n_k}$ (Alternate statement of Multinomial theorem)

2) The expression $\frac{n!}{n_1! n_2! \dots n_k!}$ is also written as $\binom{n}{n_1, n_2, \dots, n_k}$

3) Multinomial theorem can also be stated as

$$(x_1 + x_2 + \dots + x_k)^n = \sum_{n_i} \binom{n}{n_1, n_2, \dots, n_k} x_1^{n_1} x_2^{n_2} \dots x_k^{n_k}$$

Problems :-

1) Prove the following identities for a positive integer n :

$$(i) \binom{n}{0} + \binom{n}{1} + \dots + \binom{n}{n} = 2^n$$

$$(ii) \binom{n}{0} - \binom{n}{1} + \binom{n}{2} - \dots + (-1)^n \binom{n}{n} = 0.$$

Soln:- The binomial theorem for a positive integral index n is given by $(x+y)^n = \sum_{r=0}^n \binom{n}{r} x^r y^{n-r}$.

$$(i) \text{ Taking } x=1; y=1, \text{ we get} \\ 2^n = \sum_{r=0}^n \binom{n}{r} 1^r 1^{n-r} = \sum_{r=0}^n \binom{n}{r}$$

$$\therefore 2^n = \binom{n}{0} + \binom{n}{1} + \dots + \binom{n}{n}$$

$$(ii) \text{ Taking } x=-1; y=1, \text{ we get} \\ 0 = \sum_{r=0}^n \binom{n}{r} (-1)^r 1^{n-r} = \sum_{r=0}^n (-1)^r \binom{n}{r} \\ \Rightarrow 0 = \binom{n}{0} - \binom{n}{1} + \binom{n}{2} - \dots + (-1)^n \binom{n}{n}$$

P.T.O

2) Compute the following:

$$(i) \begin{pmatrix} 12 \\ 5,3,2,2 \end{pmatrix}$$

$$(ii) \begin{pmatrix} 8 \\ 4,2,2,0 \end{pmatrix}$$

$$(iii) \begin{pmatrix} 10 \\ 5,3,2,2 \end{pmatrix}$$

(15)

$$\text{Soln: } (i) \begin{pmatrix} 12 \\ 5,3,2,2 \end{pmatrix} = \frac{12!}{5!3!2!2!} = 1,66,320$$

(iii) Meaningless since
 $5+3+2+2=12 > n=10$

$$(ii) \begin{pmatrix} 8 \\ 4,2,2,0 \end{pmatrix} = \frac{8!}{4!2!2!} = 420.$$

3) Find the sum of all coefficients in the expansion of

$$(a) (x+y)^n \quad (b) (x_1+x_2+\dots+x_k)^n$$

$$\text{Soln: } (a) \text{ we have } (x+y)^n = \sum_{r=0}^n \binom{n}{r} x^r y^{n-r}$$

Taking $x=1, y=1$, we get

$$2^n = \sum_{r=0}^n \binom{n}{r} 1^r 1^{n-r} = \sum_{r=0}^n \binom{n}{r}$$

$$\therefore 2^n = \binom{n}{0} + \binom{n}{1} + \dots + \binom{n}{n}$$

Thus, the sum of all the coefficients in the expansion of $(x+y)^n$ is 2^n .

(b) By Multinomial theorem, we have

$$\sum_{n_i} \binom{n}{n_1, n_2, \dots, n_k} x_1^{n_1} x_2^{n_2} \dots x_k^{n_k} = (x_1 + x_2 + \dots + x_k)^n$$

$x_1=1, x_2=1, \dots, x_k=1$, we get

$$\sum_{n_i} \binom{n}{n_1, n_2, \dots, n_k} = (1+1+\dots+1)^n \text{ times} = K^n.$$

Thus, the sum of all the coefficients in the expansion of $(x_1+x_2+\dots+x_k)^n$ is K^n .

4) Obtain the sum of all the coefficients in the expansion

$$(i) (x+y)^{10} \quad (ii) (x+y+z)^2 \quad (iii) (x+y+z+w)^5$$

$$(iv) (2s-3t+5u+6v-11w+3x+2y)^{10}$$

- Soln:-
- From result (a) of above problem, the sum of the coefficients in the expansion of $(x+ty)^{10}$ is 2^{10} .
 - From result (b) of above problem, the sum of the coefficients in the expansion of $(x+ty+z)^{12}$ is 3^{12} .
 - From result (b) again, sum of coefft in the expansion of $(x+ty+z+w)^5$ is 4^5 .
 - By virtue of the multinomial theorem, we have

$$\begin{aligned}
 & (2s - 3t + 5u + 6v - 11w + 3x + 2y)^{10} = \\
 &= \sum_{n_1} \binom{10}{n_1, n_2, \dots, n_7} (2s)^{n_1} (-3t)^{n_2} (5u)^{n_3} (6v)^{n_4} (-11w)^{n_5} \\
 & \quad (3x)^{n_6} (2y)^{n_7} \\
 &= \sum_{n_1} \binom{10}{n_1, n_2, \dots, n_7} 2^{n_1} (-3)^{n_2} 5^{n_3} 6^{n_4} (-11)^{n_5} 3^{n_6} 2^{n_7} \times \\
 & \quad s^{n_1} t^{n_2} u^{n_3} v^{n_4} w^{n_5} x^{n_6} y^{n_7}
 \end{aligned}$$

Taking $s=1, t=1, u=1, v=1, w=1, x=1, y=1$ we get

$$(2-3+5+6-11+3+2)^{10} = \sum_{n_1} \binom{10}{n_1, n_2, \dots, n_7} 2^{n_1} (-3)^{n_2} 5^{n_3} 6^{n_4} (-11)^{n_5} 3^{n_6} 2^{n_7}$$

The sum in the RHS of the above expression is the sum of the coefficients in the expansion of $(2s - 3t + 5u + 6v - 11w + 3x + 2y)^{10}$.

$$\begin{aligned}
 \text{This sum} &= (2-3+5+6-11+3+2)^{10} \\
 &= 4^{10}
 \end{aligned}$$

5) find the coefficient of

- $x^3 y^9$ in the expansion of $(x+2y)^{12}$.
- x^n in the expansion of $\left(3x^2 - \frac{2}{x}\right)^{15}$
- x^{12} "
- x^k " where n is a true integer & $0 \leq k \leq n+2$.

Soln - (i) By Binomial theorem,

$$(x+2y)^{12} = \sum_{r=0}^{12} \binom{12}{r} x^r (2y)^{12-r}$$

$$= \sum_{r=0}^{12} \binom{12}{r} 2^{12-r} \cdot x^r y^{12-r}$$

Taking $r=3$ in the above expansion, the coefficient of $x^3 y^9$ is $\binom{12}{3} 2^9 = \frac{12!}{9! 3!} \cdot 2^9 = 11,2640$

(ii) By Binomial theorem,

$$\left(3x^2 - \frac{2}{x}\right)^{15} = \sum_{r=0}^{15} \binom{15}{r} (3x^2)^r \cdot \left(-\frac{2}{x}\right)^{15-r}$$

$$= \sum_{r=0}^{15} \binom{15}{r} 3^r \cdot (-2)^{15-r} \cdot x^{2r} \cdot \left(\frac{1}{x}\right)^{15-r}$$

$$= \sum_{r=0}^{15} \binom{15}{r} 3^r \cdot (-2)^{15-r} \cdot x^{2r} \cdot x^{r-15}$$

$$= \sum_{r=0}^{15} \binom{15}{r} 3^r \cdot (-2)^{15-r} \cdot x^{3r-15}$$

Taking $r=5$ in the above expansion, the coefficient of x^0 is $\binom{15}{5} 3^5 \cdot (-2)^{10} = 15C_5 \cdot 3^5 \cdot (-2)^{10} = 747242496$

(iii) By binomial theorem,

$$(1-2x)^{10} = \sum_{r=0}^{10} \binom{10}{r} 1^{10-r} \cdot (-2x)^r$$

$$\therefore x^3 (1-2x)^{10} = \sum_{r=0}^{10} \binom{10}{r} \cdot (-2)^r \cdot x^{r+3}$$

Taking $r=9$ in the above expansion, we get the coeff of x^{12} as $\binom{10}{9} (-2)^9 = 10C_9 \times (-2)^9 = -5,120$

(iv) Using binomial theorem,

$$(1+x)^n = \sum_{r=0}^n \binom{n}{r} 1^{n-r} x^r$$

$$\therefore (1+x+x^2)(1+x)^n = (1+x+x^2) \sum_{r=0}^n \binom{n}{r} x^r$$

$$= \sum_{r=0}^n \binom{n}{r} x^r + \sum_{r=0}^n \binom{n}{r} x^{r+1} + \sum_{r=0}^n \binom{n}{r} x^{r+2}$$

Coeff of x^k is obtained by taking $r=k$ in 1st sum,
 $r=k-1$ in 2nd sum & $r=k-2$ in 3rd sum.

∴ Coeff of x^k is

$$\binom{n}{k} + \binom{n}{k-1} + \binom{n}{k-2}.$$

Say; for Ex:- Coeff of x^{15} is $\binom{n}{15} + \binom{n}{14} + \binom{n}{13}$.

Q) Determine the coefficient of the following :-

(i) xyz^5 in the expansion of $(x+y+z)^7$

$$(ii) x^2y^2z^3 \quad " \quad (3x-2y-4z)^7$$

$$(iii) x^6y^4 \quad " \quad (2x^3-3xy^2+z^2)^6$$

$$(iv) xyz^{-2} \quad " \quad (x-2y+3z^{-1})^4$$

$$(v) a^2b^3c^2d^5 \quad " \quad (a+2b-3c+2d+5)^{16}$$

Soln:- (i) By multinomial theorem, we have that the General term in the expansion of $(x+y+z)^7$ is

$$\binom{7}{n_1, n_2, n_3} x^{n_1} y^{n_2} z^{n_3}$$

for $n_1=1, n_2=1, n_3=5$, we have

$$\binom{7}{1, 1, 5} xyz^5 = \frac{7!}{1! 1! 5!} xyz^5 = 42 xyz^5$$

This shows that the required coefficient of xyz^5 is 42.

(i) The general term in the expansion of $(3x - 2y - 4z)^7$ (17)

$$\text{is } \binom{7}{n_1, n_2, n_3} (3x)^{n_1} (-2y)^{n_2} (-4z)^{n_3}.$$

for $n_1 = 2$; $n_2 = 2$, $n_3 = 3$, we have

$$\begin{aligned} & \binom{7}{2, 2, 3} (3x)^2 (-2y)^2 (-4z)^3 \\ &= \binom{7}{2, 2, 3} 3^2 \cdot (-2)^2 \cdot (-4)^3 x^2 y^2 z^3 \end{aligned}$$

$$\therefore \text{coeff of } x^2 y^2 z^3 \text{ is } \binom{7}{2, 2, 3} \times 9 \times 4 \times (-64)$$

$$= -2304 \times \frac{7!}{2! 2! 3!} = -4,83,840$$

(iii) The general term in the expansion of $(2x^3 - 3xy^2 + z^2)^6$ is

$$\binom{6}{n_1, n_2, n_3} (2x^3)^{n_1} (-3xy^2)^{n_2} (z^2)^{n_3}$$

$$\begin{aligned} \text{or } T_n &= \binom{6}{n_1, n_2, n_3} 2^{n_1} (-3)^{n_2} \cdot x^{3n_1} \cdot y^{2n_2} \cdot z^{2n_3} \\ &= \binom{6}{n_1, n_2, n_3} 2^{n_1} (-3)^{n_2} \cdot x^{3n_1 + n_2} \cdot y^{2n_2} \cdot z^{2n_3} \end{aligned}$$

$\begin{matrix} 3n_1 + 2 = 11 \\ 3n_1 = 9 \\ n_1 = 3 \end{matrix}$, we have

for $n_3 = 0$; $n_2 = 2$; $n_1 = 3$, we have

$$\binom{6}{3, 2, 0} 2^3 (-3)^2 \cdot x^9 y^4$$

$\therefore \text{coeff of } x^9 y^4 \text{ is } 2^3 (-3)^2 \cdot \binom{6}{3, 2, 0}$

$$= 8 \times 9 \times \frac{6!}{3! 2! 0!} = 4320$$

(iv) The general term in the expansion of $(x - 2xy + 3z^{-1})^4$ is

$$\binom{4}{n_1, n_2, n_3} x^{n_1} (-2y)^{n_2} (3z^{-1})^{n_3}$$

$$= \binom{4}{n_1, n_2, n_3} (-2)^{n_2} 3^{n_3} \cdot x^{n_1} \cdot y^{n_2} \cdot z^{-n_3}$$

for $n_1=1, n_2=1, n_3=2$, we have

$$\binom{4}{1,1,2} (-2)^1 \cdot 3^2 \cdot xyz^{-2}$$

\therefore coeff of xyz^{-2} is $-2 \cdot 9 \times \binom{4}{1,1,2}$

$$= -18 \times \frac{4!}{1!1!2!} = -216$$

(v) The general term in the expansion of $(a+2b-3c+2d+5)^{16}$

is $\binom{16}{n_1, n_2, n_3, n_4, n_5} a^{n_1} (2b)^{n_2} (-3c)^{n_3} (2d)^{n_4} 5^{n_5}$

for $n_1=2; n_2=3, n_3=2, n_4=5$; $n_5=16-(2+3+2+5)$
i.e. $n_5=4$, we have $\begin{cases} n_1+\dots+n_5=n \\ \Rightarrow n_5=n-(n_1+\dots+n_4) \end{cases}$

$$\binom{16}{2,3,2,5,4} 2^3 \cdot (-3)^2 \cdot 2^5 \cdot 5^4 a^2 b^3 c^2 d^5$$

\therefore coeff of $a^2 b^3 c^2 d^5$ is $8 \times 9 \times 2^5 \cdot 5^4 \times \binom{16}{2,3,2,5,4}$

$$= 1440000 \times \frac{16!}{2!3!2!5!4!}$$

Hw
Find the coefficient of:

1) $x^5 y^2$ in the expansion of $(2x-3y)^7$

2) $x^3 z^4$ " " " " " $(x+y+z)^7$

3) $x^3 y^3 z^2$ " " " " " $(2x-3y+5z)^8$

4) $w^3 x^2 y z^2$ " " " " " $(2w-x+3y-2z)^8$

5) $x_1^2 x_3 x_4^3 x_5^4$ " " " " " $(x_1+x_2+x_3+x_4+x_5)^{10}$.

Combinations with Repetitions :

Suppose we have to select a combination of r -objects, with repetitions, from a set of n -distinct objects, where ~~if~~, then the no. of such selections is given by

$$C(n+r-1, r) = \frac{(n+r-1)!}{r! (n-1)!} = C(r+n-1, n-1)$$

i.e. $C(n+r-1, r) = C(r+n-1, n-1)$ represents the no. of Combinations of n distinct objects, taken ' r ' at a time, with repetitions allowed.

Note :- \Rightarrow Eqⁿ (1) represents the no. of ways in which r identical objects can be distributed among n distinct containers.

\Rightarrow Eqⁿ (1) also represents the no. of non-negative integer soln's of the eqⁿ $x_1 + x_2 + \dots + x_n = r$.

[A non-negative integer soln of the eqⁿ $x_1 + x_2 + \dots + x_n = r$ is an n -tuple (x_1, x_2, \dots, x_n) , where x_1, x_2, \dots, x_n are non-negative integers whose sum is r]

Problems :-

1) In how many ways can we distribute 10 identical marbles among 6 distinct containers?

Soln:- Here $r = 10$; $n = 6$.

$$\therefore \text{Required no. is } C(6+10-1, 10) = C(15, 10) \\ = \frac{15!}{10! 5!} = 3003.$$

2) find the no. of ways of placing 8 identical balls in 5 numbered boxes?

Soln:- Here $r = 8$; $n = 5$

$$\text{Required no. is } C(5+8-1, 8) = C(12, 8) = \frac{12!}{8! 4!} = 495.$$

3) A bag contains coins of 7 different denominations, with at least 1 dozen coins in each denomination. In how many ways can we select a dozen coins from the bag?

Soln.: Here $r=12$; $n=7$.

The no. of ways making a selection of dozen coins from the bag is $C(7+12-1, 12) = C(18, 12) = \frac{18!}{12!6!} = 18,564.$

4) Find the no. of non-negative integer solutions of the eqⁿ
 $x_1+x_2+x_3+x_4+x_5 = 8$.

Soln.: The required no. is $C(5+8-1, 8) = C(12, 8)$

$$\left[\text{Since here } r=8; n=5 \right] = \frac{12!}{8!4!} = 495.$$

5) Find the no. of non-negative integer soln of the eqⁿ

$$x_1+x_2+x_3+x_4 = 7$$

Soln.: Here $n=4$; $r=7$.

$$\text{Required no. is } C(4+7-1, 7) = C(10, 7) = \frac{10!}{7!3!}$$

=

6) Find the no. of distinct terms in the expansion of

$$(x_1+x_2+x_3+x_4+x_5)^{16}$$

Soln.: The general term in the expansion of $(x_1+x_2+x_3+x_4+x_5)^{16}$

is of the form $\binom{16}{n_1, n_2, n_3, n_4, n_5} x_1^{n_1} x_2^{n_2} x_3^{n_3} x_4^{n_4} x_5^{n_5}$ where each n_i is a non-negative integer & the sum of these n_i 's is 16.

\therefore No. of distinct terms in the expansion = the no. of non-negative integer solutions of the eqⁿ $n_1+n_2+n_3+n_4+n_5 = 16$

$$\therefore \text{Required no. is } C(5+16-1, 16) = C(20, 16) = 4845.$$

7) Find the no. of non-negative integer soln's of the inequality $x_1 + x_2 + \dots + x_6 \leq 10$. (19)

Soln: Given $x_1 + x_2 + \dots + x_6 \leq 10$.
 $\Rightarrow x_1 + x_2 + \dots + x_6 = 9 - x_7$, $\left[\begin{array}{l} \text{Ex: } 2+3 < 10 \\ \Rightarrow 2+3 = 9-4 \end{array} \right]$

so that x_7 is a non-negative integer.

\therefore the required no. is the no. of non-negative solns of the eqn $x_1 + x_2 + \dots + x_7 = 9$.

This no. is $C(7+9-1, 9) = C(15, 9) = 5005$.

8) Find the no. of distinct terms in the expansion of $(w+x+y+z)^{10}$.

The general term in the expansion of $(w+x+y+z)^{10}$

Soln: The general term is $\binom{10}{n_1, n_2, n_3, n_4} w^{n_1} x^{n_2} y^{n_3} z^{n_4}$ where each n_i is a non-negative integer if the sum of

these n_i 's is 10.

\therefore no. of distinct terms in the expansion = no. of non-negative integer soln of the eqn $n_1 + n_2 + n_3 + n_4 = 10$.

This no. = $C(4+10-1, 10) = C(13, 10) = 286$.

9) Find the no. of non-negative integer soln of the inequality

$x_1 + x_2 + \dots + x_5 \leq 19$

$x_1 + x_2 + \dots + x_5 + x_6 \leq 19$.

Soln: Given $x_1 + x_2 + \dots + x_5 = 19 - x_6$, so that x_6 is non-negative
 \therefore Required no. = no. of non-negative integer solns of the eqn $x_1 + x_2 + \dots + x_5 + x_6 = 19$.

This no. is $C(6+19-1, 19) = C(24, 19)$
 $= 42,504$.

10) Find the no. of integer solutions of
 $x_1 + x_2 + \dots + x_5 = 30$ where $x_1 \geq 2, x_2 \geq 3, x_3 \geq 4,$
 $x_4 \geq 2, x_5 \geq 0.$ $\hookrightarrow (1).$

Soln:- Let $y_1 = x_1 - 2; y_2 = x_2 - 3; y_3 = x_3 - 4$
 $y_4 = x_4 - 2; y_5 = x_5.$

then y_1, y_2, \dots, y_5 are all non-negative integers.

Given eqn now becomes,

$$(y_1+2) + (y_2+3) + (y_3+4) + (y_4+2) + y_5 = 30$$

$$\Rightarrow y_1 + y_2 + y_3 + y_4 + y_5 = 30 - 11 \quad y_i \geq 0 \text{ for } i=1, 2, \dots, 5.$$

$$\Rightarrow y_1 + \dots + y_5 = 19. \quad \rightarrow (2).$$

No. of non-negative integer soln of (2) is

$$C(5+19-1, 19) = C(24-1, 19) = C(23, 19)$$

$$= 8855$$

11) How many integer soln's are there to $x_1 + x_2 + \dots + x_5 = 20$
~~where $x_i \geq 2?$~~

Soln:- Given $x_1 \geq 2; x_2 \geq 2 \dots x_5 \geq 2. \quad y_5 = x_5 - 2$

Let $y_1 = x_1 - 2; y_2 = x_2 - 2 \dots$

\therefore Given eqn becomes

$$y_1+2+y_2+2+y_3+2+y_4+2+y_5+2 = 20.$$

$$\Rightarrow y_1 + y_2 + \dots + y_5 = 10.$$

$$\therefore \text{Required no.} = C(5+10-1, 10) = C(14, 10) = 1001.$$

12) In how many ways can we distribute 12 identical pencils
~~to 5 children so that every child gets atleast 1 pencil?~~

~~So, first let us distribute one pencil to each child.~~

~~So, Remaining 7 pencils are to be distributed to 5 children.~~
~~This can be done in~~ $C(5+7-1, 7) = C(11, 7)$
 $n=5, r=7$
 $= 330 \text{ ways.}$

13) In how many ways can 10 identical pens be distributed among 5 children in the foll cases:-

(i) There are no restrictions.

(ii) Each child gets atleast one pen

(iii) The youngest child gets atleast 2 pens.

Soln:- (i) Since there are No restrictions in ~~distributing~~ distributing 10 pens to 5 children, no of ways of distribution is $C(5+10-1, 10) = C(14, 10) = 1001$

(ii) First we distribute one pen to each child. Then the remaining 5 pens are to be distributed among 5 children in $C(5+5-1, 5) = C(9, 5) = 126$ ways.

(iii) first we give 2 pens to the youngest child, then the remaining 8 pens are to be distributed among 5 children. This can be done in

$$C(5+8-1, 8) = C(12, 8) = 495 \text{ ways.}$$

14) In how many ways can one distribute eight identical balls into 4 distinct containers so that

(i) No container is empty?

(ii) the 4th container gets an odd no of balls?

Soln:- (i) First we distribute one ball to each container.

then the remaining 4 balls is to be distributed among 4 containers & this can be done in

$$C(4+4-1, 4) = C(7, 4) = 35 \text{ ways}$$

(ii) If the 4th container has to get an odd no of balls, we have to put 1 (or) 3 (or) 5 (or) 7 balls into it.

Case (i) :- Suppose we put 1 ball to 4th container, then the remaining 7 balls ~~can~~ be distributed into the remaining 3 containers in $C(3+7-1, 7) = C(9, 7)$ ways.

Case (ii) :- Suppose we put 3 balls to 4th container, then the remaining 5 balls can be distributed into the remaining

3 containers in $C(3+5-1, 5) = C(7, 5)$ ways.

Case (iii) :- Suppose we put 5 balls to 4th container, then the remaining 3 balls can be distributed into the remaining 3 containers in $C(3+3-1, 3) = C(5, 3)$ ways.

Case (iv) :- $C(3+1-1, 1) = C(3, 1)$ ways.

∴ Total no. of ways of distributing the given balls with the given cond' is

$$C(9, 7) + C(7, 5) + C(5, 3) + C(3, 1) = 70.$$

15) Find the no. of ways of distributing 7 identical pens & 7 identical pencils to 5 children so that each gets atleast 1 pen & atleast 1 pencil.

Soln:- First let us distribute 1 pen & 1 pencil to each child, then the remaining 2 pens can be distributed to

$$5 \text{ children in } C(5+2-1, 2) = C(6, 2) \text{ ways.}$$

Similarly the remaining 2 pencils can be distributed to

$$5 \text{ children in } C(5+2-1, 2) = C(6, 2) \text{ ways.}$$

∴ no. of ways of distributing the given sets under the given cond'n is $C(6, 2) \times C(6, 2)$

$$= 225$$

16) find the no. of ways of giving 10 identical gift boxes to 6 persons A, B, C, D, E, F in such a way that the total no. of boxes given to A & B together does not exceed 4.

Soln:- of the 10 boxes, suppose 'x' boxes are given to A & B together, then $0 \leq x \leq 4$.

∴ no. of ways of giving 'x' boxes to A & B is

$$C(2+x-1, x) = C(x+1, x) = \frac{(x+1)!}{x! 1!} = \frac{(x+1)x!}{x!} = x+1 \quad \hookrightarrow (1).$$

of ways in which remaining $(10-r)$ boxes

(21)

can be given to C, D, E, F is

$$C(4+(10-r)-1, (10-r)) = C(13-r, 10-r)$$

→ (2).

Consequently, the no. of ways in which r 's boxes may be given to A & B and $(10-r)$ boxes to C, D, E, F is

$$(r+1) \times C(13-r, 10-r).$$

Since $0 \leq r \leq 4$, Total no. of ways in which the boxes may be given is,

$$\sum_{r=0}^4 (r+1) \times C(13-r, 10-r).$$

∴

17) A total amount of Rs 1800 is to be distributed to 3 poor students A, B, C of a class. In how many ways the distribution can be made in multiples of Rs 100 if

(i) everyone of these must get atleast Rs 200?

(ii) A must get atleast Rs 500, & B & C must get atleast Rs 400 each?

Soln:- Taking Rs 100 as a unit, there are 15 units for distribution, among 3 students A, B, C.

∴ Each of the 3 students must get atleast 3 units.

Case (i): Each of the 3 students must get atleast 3 units to each A, B, C. then the remaining 6 units are to be distributed to A, B, C, and this can be done in $C(3+6-1, 6) = C(8, 6) = 28$ ways.

Case (ii) :- A must get atleast 5 units & B & C must get atleast 4 units each.

∴ let us first distribute 5 units to A & 4 units each to B & C, then the remaining 2 units are to be distributed to A, B, C. This can be done in $C(3+2-1, 2) = C(4, 2) = 6$ ways.

- 18) A total of Rs 10,000 is to be distributed to 4 persons A, B, C, D in multiples of Rs 1000. In how many ways can the distribution be done (i) if there is no restriction (ii) if everyone of these persons should receive atleast Rs 1000 Re 1000? (iii) If everyone should receive atleast Rs 5000 & A in particular should receive atleast Rs 5000?

Soln:- Taking Rs 1000 as one unit, there are 10 units for distribution, among 4 persons.

Case (i) :- Since there is no restriction, 10 units can be distributed among 4 persons in

$$C(4+10-1, 10) = C(13, 10) = 286 \text{ ways.}$$

Case (ii) :- Each of the 4 students must get atleast 1 unit. Let us first distribute 1 unit to each A, B, C, D. Then the remaining 6 units are to be distributed among 4 persons. This can be done in $C(4+6-1, 6) = C(9, 6) = 84$ ways.

Case (iii) :- A should receive atleast 5 units & each of B, C, D should receive atleast 1 unit. Let us first distribute 5 units to A, and 1 unit each to B, C, D. Then the remaining 2 units are to be distributed among 4 persons. This can be done in $C(4+2-1, 2) = C(5, 2) = 10$ ways.

- 19) A message is made up of 12 different symbols & is to be transmitted through a communication channel. In addition to the 12 symbols, the transmitter will also send a total of 45 blank spaces b/w the symbols, with atleast 3 spaces b/w each pair of consecutive symbols. In how many ways can the transmitter send such a message?

Soln:- The 12 symbols can be arranged in $12!$ ways. (22)
 For each of these arrangements, there are 11 positions
 b/w the 12 symbols. Since there must be atleast 3 spaces
 b/w consecutive symbols, we can make use of 33 black spaces out
 of 45. The remaining $\frac{(45-33)}{2} = 6$ spaces can be accommodated
 in 11 positions. This can be done in $C(11+12-1, 12)$
 $= C(22, 12)$ ways.

\therefore No. of ways the transmitter can send such a message
 is $C(22, 12) \times 12! = \frac{22!}{10! 12!} \times 12! = \frac{22!}{10!}$
 $= 3.0974 \times 10^{14}$.

Q. Six distinct symbols are transmitted through a communication channel. A total of 12 blanks are to be inserted b/w the symbols with atleast 2 blanks b/w every pair of symbols. In how many ways can the symbols and the blanks be arranged?

Soln:- The 6 symbols can be arranged in $6!$ ways. For each of these arrangements, there are 5 positions b/w the 6 symbols. Since there must be atleast 2 blanks b/w every pair of symbols, 10 of the 12 blanks will be used up. The remaining 2 blanks are to be accommodated in 5 positions. This can be done in $C(5+2-1, 2) = C(6, 2)$ ways.
 \therefore No. of ways the symbols & the blanks can be arranged is $C(6, 2) \times 6! = 10,800$.
